

Abstract

The system of the present invention facilitates the recycling of paper materials. Essentially, the invention consists of a pre-paid postage mailing label, addressed to a recycling or de-inking facility, which is removeably attached or covered on a paper based communication. After the paper based communication has been used for its intended purpose, the consumer or recipient of that communication will affix or uncover the pre-paid postage mailing label, and will deposit the communication in a suitable mail depository. From the depository, it will be delivered to the recycling or de-inking facility.
